São Carlos / SP

Determinação da rigidez à rotação de ligações pré-moldadas utilizando o método dos componentes

Eng. P. H. ALENCAR

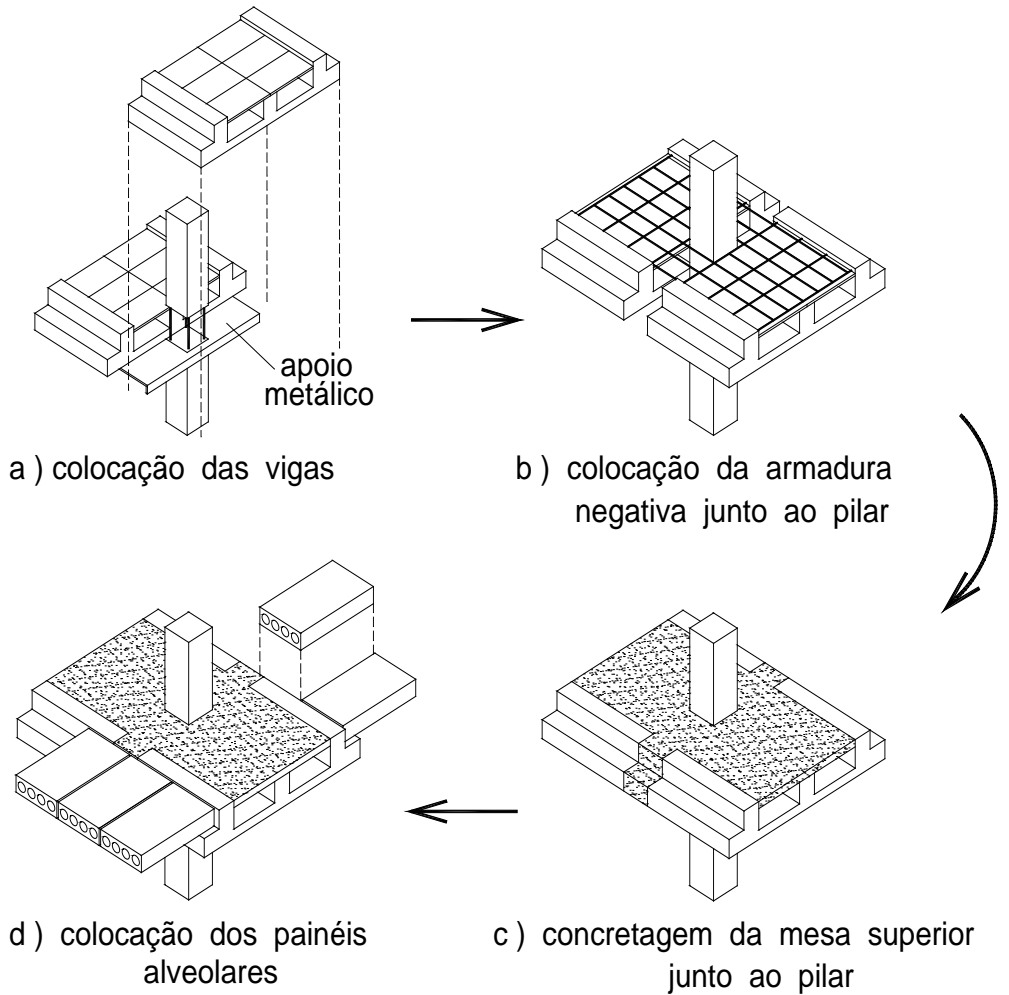

Prof. Evandro PARENTE Jr.

Prof. Augusto T. de ALBUQUERQUE

UNIVERSIDADE
FEDERAL DO CEARÁ

UN System (1991)

Avaliação x Possibilidades (2006)

- Quantidade de trabalho nas fases de montagem.
- Mínimo de forma e trabalho manual;
- HC montadas antes das conexões;
- Equipes montagem independentes;
- Vigas contínuas desde montagem HC;
- Conexões → Vento e Sismo.

Objetivos: MidWest System (2006)

1) Relação ℓ / h próxima aos pavimentos cml e estruturas mistas (Delta rigidez ligações;

2) Eliminar consoles;

3) Montagem pórticos anterior à concretagem;

4) Eliminar Shear Wall;

5) Fácil Execução.

Viga

Pocket

Chapa

Posicionamento Vigas

Etapa 1 -Conexão Perfil Metálico

Etapa 2 - Posicionamiento Lajes

Armatura Pocket

Preenchimento pocket

Etapa 3 – Conclusão Pocket

Armadura Adicional

Etapa 4 - Capa de concreto

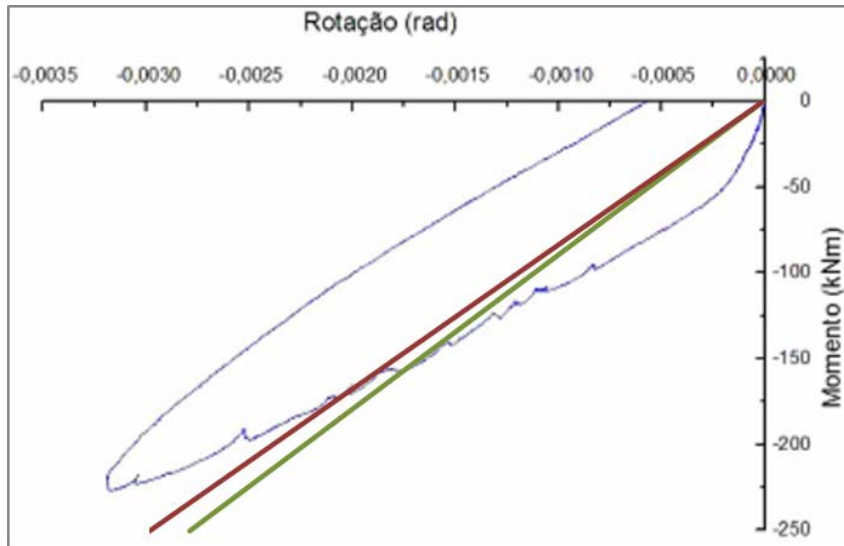

Modelo Mecânico (MOTA 2009)

- Generalizou Método dos Componentes para novas ligações;
- Extremo Viga \rightarrow Chapa Rígida;
- Molas representam a rigidez dos elementos à rotação \rightarrow Mecanismos Transferência da Comissão da FIB.

Validação Implementação

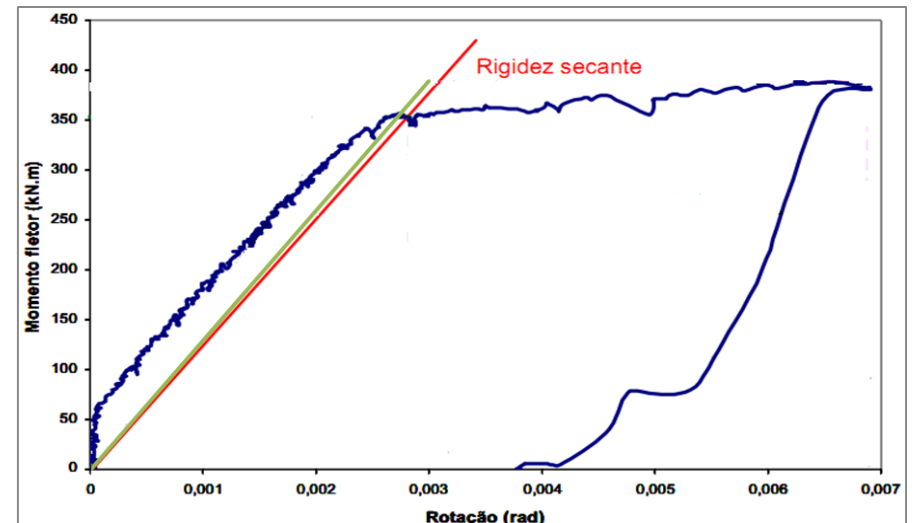

Baldissera (2006)

	Ensaio	Modelo	Diferença (%)
K (kNm/rad)	84000	90218	6,9%
α_r	0,615	0,632	2,7%

	Ensaio	Modelo	Diferença (%)
K (kNm/rad)	120689	128771	6,3%
α_r	0,741	0,754	1,7%

Kataoka (2007)

Modelo Adotado

Componente	Rigidez (kN/m)	x (m)	y (m)	α (graus)
Concreto	1.000E+10	0.00	0.03	0
Reforço 1	1.255E+06	0.00	0.38	0
Reforço 2	2.940E+05	0.00	0.30	0
Reforço 3	2.940E+05	0.00	0.23	0
Perfis Metálicos	1.000E+10	0.00	0.00	90

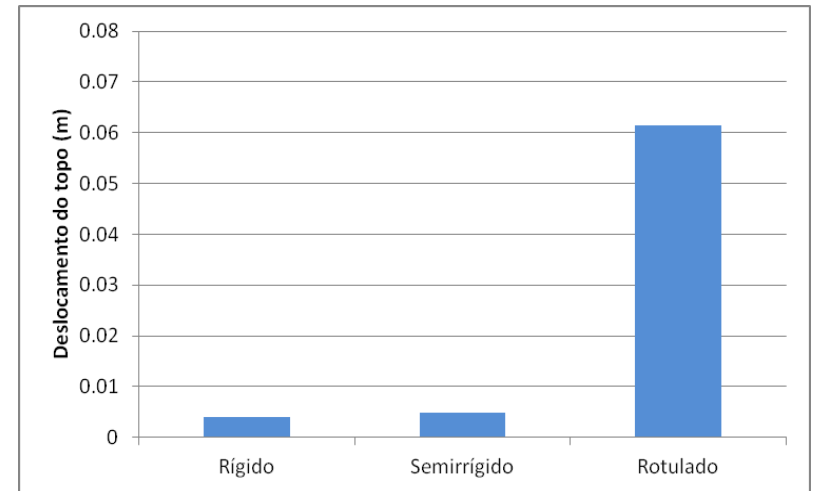

Resultado: Parâmetro de restrição (α_r)

$$\alpha_r = 0,83$$

$$\alpha_r = \frac{1}{1 + \frac{3 \cdot (EI)_{\text{sec}}}{R_{\text{sec}} \cdot L_{\text{ef}}}} = \frac{\theta_1}{\theta_2}$$

Exemplo

Obrigado.
